

CAPABILITIES BRIEF

Governed Agentic AI Delivery

SDVOSB Specialist Delivery & Teaming Partner — prepared for Ampcus Inc.

M2M~Inc. operates a deployed, production instance of the governed agentic AI architecture that enterprise programs are still trying to reach. Not a pilot. Not a slide. A live system with human-in-the-loop approval gates, audit logging, and tool allow-lists, already routing and authenticating real work. The objective of this brief is direct: position M2M as the SDVOSB partner Ampcus engages where production-grade AI execution and category-eligible subcontracting meet on the same engagement.

BUILT ON THE SAME DOCTRINE AS THE AMPCUS TRAC FRAMEWORK

AMPCUS TRAC PRINCIPLE	WHAT M2M RUNS IN PRODUCTION TODAY
Trust Grounded, permission-aware outputs	A pre-distribution Trust/Liability gate scans every output before it routes — banned-vocabulary enforcement and claim verification run before any send, not after.
Reliability Operational discipline, monitoring	Five orchestrated automation scenarios feed four production data tables, with an execution log and auto-logger capturing every run for review and change control.
Adoption Workflow-native, embedded	The human-transformation layer Ampcus deployments need to make AI stick — the discipline that moves end users from old process to new without reverting.
Control Bounded autonomy, approvals, audit	An 80/20 execution doctrine: the pipeline executes, a named principal authenticates. Tool allow-lists, an approval queue, and a deployed approval dashboard govern every action.

LIVE TODAY — THE PROOF

- ◆ **Operating platform** at model2message.net with client portal, cohort infrastructure, and a deployed Sovereign Approval Dashboard.
- ◆ **Production stack:** Supabase, Vercel, Claude API, HubSpot, and Make.com — integrated, not theoretical.
- ◆ **Three proprietary OS lanes:** PIVOT OS™ (individual), BRIDGE OS™ (employer/SMB), Human OS™ (enterprise/GovCon).
- ◆ **Pilot-to-production gap, already crossed** — the exact stall point most enterprise AI programs never clear.

CERTIFICATION & VEHICLE FIT

- ◆ **SDVOSB + VBE** certified; DOBE in process — a distinct category line beyond the diverse-owned status Ampcus already holds.
- ◆ **Navy-veteran founder.** M2M's SDVOSB status aligns with the small-business teaming Ampcus pursues on Navy Seaport NxG.
- ◆ **Subcontract-ready governance:** NDA, FAR subcontract flowdown, and subcontractor lifecycle standards already drafted and filed.
- ◆ **Built for the protégé model** Ampcus runs with qualified diverse suppliers.

THREE WAYS TO ENGAGE

01

Subcontract / Protégé Partner

An SDVOSB teammate that helps Ampcus meet category-specific subcontracting goals on its federal vehicles, starting with Navy Seaport NxG.

02

Specialist Delivery Partner

Governed agentic builds — operations command centers, approval-gated workflows, document and intake automation — delivered fast off a working reference architecture.

03

The Adoption Layer

The human-side change framework that turns a technically successful AI deployment into one end users actually keep using.
